EDUCATION

BACHELOR OF COMPUTER ENGINEERING

University of Cebu
2008-2013

SECONDARY SCHOOL

Don Bosco Technology Center
2004-2008

SKILLS

- Programming Languages:** JavaScript (ES6+), TypeScript, C#
- Frontend Technologies:** HTML5, CSS3, React.js, Next.js, Remix, Angular, Vue.js
- Backend & Runtime Environments:** Node.js, .NET (.NET Core / ASP.NET)
- State Management & Reactive:** Redux, RxJS
- Tooling & Build Systems:** Webpack, Rollup, Vite, Nx, Bun, ESLint, Storybook
- Testing:** Jest, Vitest, Playwright, Contract Testing (Pact), Visual Regression
- Version Control & CI/CD:** Git, GitHub, Buildkite, CircleCI
- Observability & Experimentation:** Datadog monitors and runbooks, A/B design and analysis, SQL / Trino
- Performance Optimization:** Lazy Loading, Code Splitting, Tree Shaking, Caching
- AI-Assisted Development:** Coding agents and workflows, Claude Skills, prompt engineering

CRIS RYAN TAN

SOFTWARE ENGINEER

SUMMARY

Innovative and detail-oriented Senior Full-stack Engineer with a specialisation in Frontend technologies and deep expertise designing and developing high-performance, scalable web applications.

Expert in modern JavaScript frameworks, with a strong focus on creating intuitive, responsive, and accessible user interfaces. Sound experience in backend development, DevOps projects, and end-to-end testing.

Passionate about user experience, clean code, and staying current with emerging technologies.

EXPERIENCE

SENIOR SOFTWARE ENGINEER

Rokt - Sydney, Australia

Feb 2026 - Present

- Built the contract-testing (Pact) program from a single-repo experiment into cross-platform infrastructure covering all three SDK consumers (web, iOS, Android), the transactions provider, and the server-to-server surface. Own the broker end to end, including patching a critical (CVSS 10.0) CVE. Contract drift now fails at PR time instead of in production, cutting a break's blast radius from a whole release train to a single PR during the platform's largest API migration.
- Shipped the v2 offers path on both mobile SDKs: built Android end to end, structured so retiring v1 later is a clean delete, and carried a teammate's in-flight iOS work through to merged and verified live against the provider.
- Modernised the web SDK's build and CI by consolidating on Nx with affected-only scoping, sharding the PR pipeline, migrating npm to bun, and surfacing bundle size per PR. Roughly halved pipeline time (PR builds ~16 to 8-9 min, mainline ~45 to ~30 min), an estimated 153-173 engineering hours saved per quarter across the team.
- Cut SDK time to interactive by 11% at p50 and 12% at p95 through code-splitting, an explicit browser-support floor that let legacy polyfills go, and phasing bootstrap into critical and deferred work. Separately traced a ~325ms p95 render-latency regression on a top-tier partner to always-on code a rollout had left behind an incomplete kill switch, recovering ~247ms across 7.6M sessions.
- Rebuilt the on-call surface ahead of new engineers joining the rotation: replaced a stale 9-code runbook with one covering the ~150 error codes the SDK actually emits, added back-tested per-code monitors, and caught a silently soft-failing Terraform step that had left 35 merged monitor changes undeployed.
- Ran the investigations that kept the migration window honest, reclassifying a reported multi-advertiser revenue loss down to the handful actually affected, and diagnosed a cookie public-suffix bug where domain fallback resolved a partner's parent domain to a suffix browsers reject, silently breaking first-party session continuity across their subdomains during go-live.
- Invested in team leverage: guardrails for AI-generated code and performance guidelines in AGENTS.md, reusable playbooks for pitching and code review, three engineering initiatives pitched through the internal accelerator, and an upstream fix merged into the open-source testcafe-hammerhead project.

SENIOR SOFTWARE ENGINEER

Lorikeet - Sydney, Australia

Sept 2025 - Feb 2026

- Shipped Concierge, rebuilding Brands into Concierges as the hub for multi-channel CX config. Standardized channel-level settings as the single source of truth, aligned with a DB migration and large backfills to cut duplication and make multi-env changes safer.
- Built partner reporting for Quality Score, CSAT, and containment rate, giving partners visibility into key CX metrics across their support operations.
- Shipped Coach, an AI agent that explains metric shifts, diagnoses root causes, and recommends fixes, turning reporting data into actionable insights.
- Implemented role-based access control and laid the groundwork for platform-wide PII redaction, enabling safer data handling across workflows and reporting.
- Optimized server-side rendering performance in React/Remix by instrumenting loaders with performance markers, identifying bottleneck queries, and applying parallel execution and deferred streaming patterns. Cut average page load time from 2.2s to ~700ms (~68% reduction) and documented the playbook for reuse across the team.
- Audited the full infrastructure stack for compression and bundle size gaps across CDN, application servers, load balancers, and the Vite build pipeline. Enabled Brotli on Cloud CDN, reducing web app cold load transfer by 75% (1.56 MB to 392 KB) and chat widget transfer by 56% (1.81 MB to 795 KB). Reduced chat bundle size by ~630 KB through tree-shaking the shared design system via sideEffects configuration, eliminating 87% of one chunk.
- Built a preparative iframe preloading mechanism for the embeddable chat widget, achieving an 85% cache hit rate and cutting widget time-to-ready from 1.24s to 681ms.

SENIOR SOFTWARE ENGINEER

Rokt - Sydney, Australia

2019 - May 2025

- Developed and maintained a robust frontend SDK, empowering enterprises to deliver targeted advertising seamlessly on e-commerce sites and apps.
- Achieved a 30% reduction in SDK load time and a 40% decrease in script size, significantly improving performance and user experience.
- Adoption at scale: the SDK is deployed across top-tier companies including Ticketmaster, Best Buy, Domino's, and AMC Theatres, powering customer engagement across millions of users.
- High-volume transactions: designed and developed an SDK handling over a million transactions daily, generating almost \$2 million in daily revenue.
- Implemented guardrails by adding integration tests, visual regression tests, and end-to-end tests to ensure application robustness and reliability.

SOFTWARE ENGINEER

Leadbook - Singapore

2017 - 2018

- Managed and mentored a team of software engineers, ensuring high-quality deliverables and fostering a collaborative development environment.
- Co-structured, designed, and built the frontend of the Leadbook platform, delivering a seamless and engaging user experience.
- Spearheaded the reimplementation of the existing platform to a modern single-page application using React, Redux, and Styled Components, improving performance, scalability, and user interaction.

SOFTWARE ENGINEER

Tritontek - Cebu, Philippines

2015 - 2017

- Designed and built a Time Management application tailored for civil engineers, focusing on usability, efficiency, and reliability.
- Demonstrated and enforced proper coding techniques, emphasising maintainability, code reuse, clean code practices, and unit testing.
